FPL's Large Load Rates ensure data centers will pay their own way.

FPL

We believe Florida can have responsible data center growth without raising electric bills for our customers.

Florida Power & Light Company is committed to delivering reliable electricity every hour of every day while **keeping customer bills as low as possible.**

That's why FPL created rates that **ensure data centers pay their fair share and customers are protected** from the costs to serve new large load projects.

In other words, existing **FPL customers don't subsidize the energy needs of new data centers.**

We know technology companies are interested in Florida, and we've learned from other states that have already experienced data center growth.

FPL has established large load rates that are among the most forward-looking and protective in the nation, ensuring our existing customers are not paying for the energy needs of large load customers, including data centers.

FPL's large load rate structure is in full compliance with state data center law (SB 484).

Data centers pay: Companies must fund 100% of the new power generation required to serve their project.

Location assistance: FPL works to determine the power generation type and location to ensure continued reliability for all customers.

Required commitments: Data centers are also subject to an early exit fee that is equivalent to an accelerated payment of 100% of new power generation costs.

Customers win: FPL customers benefit from infrastructure built to serve data centers while being shielded from the costs.
